

MDO Audio TX STL - IP

Congratulations on buying a pre-configured MDO STL-IP package. The units have been pre-configured using settings that provide a high quality and reliable point to point link and require no further configuration. The diagram below demonstrates them in use with the EnGenius EOC-8610+ links. If you have not purchased an Engenius Wireless link system the units can either be connected via a network switch or directly together using a crossover network cable.

Please note that the pre-configured settings use a jitter buffer of 50ms with stereo 48kHz 24bit PCM audio. This provides a reliable connection and is suitable for most installations. If however you want to adjust any of the settings please follow the steps below.

Firstly it is first necessary to connect one of the units via a network switch. This allows a PC to be connected to the network switch to facilitate logging onto the unit over Ethernet. The IP addresses of the units are 192.168.1.10 and 192.168.1.11. These addresses can be entered into a web browser to access the devices' configuration menus. The default login details are Username: (blank) Password "broadcast".

For further information please consult the appropriate product user manuals. These can be found by clicking on the 'Downloads' tab of the product's page on www.broadcastwarehouse.com.
